

API

Your single source of truth

Total Data Synchronization

Share data seamlessly between systems with SalesPad® API—a tool that allows you to integrate SalesPad with third-party applications and synchronize data like never before. SalesPad API cuts down on time spent re-entering information into multiple systems and provides real-time visibility of data you can count on, thus improving your overall data quality.

Simplify the process of creating and updating customer information, sales documents, sales line items, and more by leveraging a highly customizable solution that plays extremely well with other applications.

Development

Note that integrating with SalesPad API will require development effort to set up the requests and responses. This can come from Cavallo's Custom Development team, a contracted third party, or your own in-house team.

“SalesPad® API has been one of the most beneficial features that allows us to build our company around a web-based infrastructure.”

— Eduardo S., Technology Project Manager

Share data seamlessly

Spend less time re-keying information

Quickly retrieve customer information
